# Desvac

# Desvac®

The Dovac is developed and manufactured by Desvac for the injection of Day Old chicks in the hatchery. You can inject subcutaneously (SC) in the neck or intra-muscular (IM) in the leg. Syringes for doses of 0,1 ml – 0,5 ml are available. The Dovac is suitable for the administration of vaccines (both live and killed), antibiotics and vitamins.

The machine is delivered with a total counter and a pre-set counter, the later is used to count the number of birds vaccinated per chick box. A special push button to reset this counter has been conveniently positioned in the cover plate of the machine. During the design of the Dovac special attention was paid to the machine's reaction speed and ergonomics. Skilled personnel can reach a vaccination speed of up to 3000 chicks per hour.

The Dovac works on compressed air and has two (auto-purge) air filters to ensure that the air used in the machine is as clean as possible. A special feature assists one to check the exact needle position at the moment of injection. The needle is securely fixed to the syringe with a retainer nut. Necessary adjustments to machine settings have been kept to a minimum. The Dovac can be supplied with your company logo on the cover plate.
