

Hatch Spray

Desvac

The Desvac Hatch Spray is a semi-automatic cabinet sprayer that works on compressed air. We recommend this cabinet sprayer for the spray vaccination of day old chicks and turkeys in the hatchery (IB, ND and TRT). If needed, we can supply a shaker to keep the vaccine in solution. We recommend a spray volume of 15 ml per box, but this can be adjusted from 0-24 ml.

The frame is made of stainless steel and uses a roller system for light handling of the crates. The vaccine bottle is autoclavable and has a capacity of 5 litres. We use a four nozzle system and depending on the nozzles used you can generate droplets with an average droplet size of 125 to 300 microns. Spray time is approximately 2 seconds per box.

The cabinet sprayer is equipped with a counter that counts the number of crates sprayed. To guarantee reliable functioning of the machine the compressed air is filtered twice (automatic purge filters). Further to this the compressed air does not come into contact with the vaccine. A stainless steel collection plate positioned under the roller system collects any excess spray liquid. You can use our water sensitive paper to check correct spray coverage of the crates.
